- 1. (**遞迴**數字總和)請撰寫一個**遞迴**函式,輸入一個整數,傳回其所有位數的數字總和。例如: 給定一個數字 7361,函式傳為 17。(提示:使用%與/,40%)
- 2. (遞迴最大公因數)整數 x 和 y 的最大公因數是指能夠同時整除 x 和 y 的最大整數值。請撰寫一個遞迴函式 gcd,傳回 x 和 y 的最大公因數。 x 和 y 的 gcd 可以遞迴地定義如下:如果 y 等於 0,那麼 gcd (x, y)為 x;否則 gcd (x, y)為 gcd (y, x%y),其中%是模數運算子。 (30%,)
- 3. (遞迴質數)請寫一個遞迴函式 isPrime,判斷給定的輸入值是否為質數。請在程式中使用此函式。(請注意,可以由數字 2 開始檢查,30%)

- 1. *(Recursive Sum of Digits)* Write a *recursive* function that takes an integer and returns the sum of its digits. For example, given the number 7631, the function should return 17. (hint: using % and /, 40%)
- 2. (Recursive Greatest Common Divisor) The greatest common divisor of integers x and y is the largest integer that evenly divides both x and y. Write a recursive function gcd that returns the greatest common divisor of x and y. The gcd of x and y is defined recursively as follows: If y is equal to 0, then gcd(x, y) is x; otherwise gcd(x, y) is gcd(y, x%y) where % the remainder operator. (30%, hint: using srand() and rand())
- 3. (*Recursive Prime*) Write a recursive function isPrime that determines whether the given input is a prime number. Use this function in a program. (hint: Starting with 2, 30%)
